

3. Project Design Phase

Import Data using Transform Maps (Spreadsheet) — ServiceNow Micro Project

Architecture

The solution follows this flow: External Spreadsheet → Import Set Table (Employee Import) → Transform Map → Field Mapping → Employee Test Target Table → Validation / Transform History → Reports → Employee Analytics Dashboard.

Source and Target Design

Source: Employee Import / u_employee_import. Target: Employee Test / u_employee_test.

Field Mapping Design

- Employee ID → Employee ID
- Employee Name → Employee Name
- Email → Email
- Department → Department
- Location → Location

Coalesce Design

Employee ID is selected as the Coalesce field. During transformation, ServiceNow compares incoming Employee ID values with existing target records. Matching IDs update the existing record; new IDs create new records.

Reporting Design

- Employees by Department — Pie Chart — Group by Department — Count.
- Employees by Location — Bar Chart — Group by Location — Count.
- Employee List Report — List — Employee ID, Employee Name, Email, Department, Location.

Dashboard Design

The Employee Analytics Dashboard contains the three reports so employee information can be viewed from one centralized location.
