

5. Project Development Phase

Import Data using Transform Maps (Spreadsheet) — ServiceNow Micro Project

Development Step 1 — Spreadsheet

Create the sample spreadsheet with Employee ID, Employee Name, Email, Department, and Location. Download it as .xlsx.

Development Step 2 — Employee Test Table

Create Employee Test with table name u_employee_test and add the five required String fields.

Development Step 3 — Import Set

Use Load Data to upload the Excel file and create Employee Import / u_employee_import.

Development Step 4 — Transform Map

Create Sample Spreadsheet Import. Set Employee Import as source and Employee Test as target.

Development Step 5 — Field Mapping

Use Auto Map Matching Fields and Mapping Assist to ensure all required source fields are connected to target fields.

Development Step 6 — Initial Transform

Run the Transform and verify the success message. Open Employee Test and confirm the imported records.

Development Step 7 — Coalesce

Open the Transform Map Field Maps and set Coalesce = True for Employee ID.

Development Step 8 — Update/Insert Test

Upload the second Excel file. Existing Employee IDs with changed details should update; new Employee IDs should insert.

Development Step 9 — Repeat Test

Upload the same second spreadsheet again and inspect Transform History to verify that unnecessary duplicate inserts do not occur.

Development Step 10 — Reports and Dashboard

Create Employees by Department, Employees by Location, and Employee List Report. Add all three to Employee Analytics Dashboards.
