

6. Project Documentation

Import Data using Transform Maps (Spreadsheet) — ServiceNow Micro Project

Documentation Purpose

This document records the complete design, implementation, testing, results, and conclusion of the ServiceNow micro project.

Abstract

This project demonstrates importing structured employee data from an external spreadsheet into ServiceNow using Import Sets and Transform Maps. Coalesce is used to identify existing employees and prevent unnecessary duplicate records. Reports and a dashboard provide visual access to employee information.

Problem Statement

Manual migration of spreadsheet employee data into ServiceNow can be time-consuming and can lead to errors or duplicates. The project provides a controlled bulk-import workflow.

Objectives

- Automate employee data loading.
- Map external spreadsheet fields to ServiceNow fields.
- Validate transformed records.
- Update existing records using Coalesce.
- Create reports and a dashboard for analysis.

Testing Summary

- Spreadsheet load — successful.
- Transform Map creation — successful.
- Initial transformation — records inserted.
- Existing Employee ID with changed values — record updated.
- New Employee ID — record inserted.
- Repeated same import — duplicate insertion avoided.
- Reports — generated successfully.
- Dashboard — reports displayed centrally.

Conclusion

The project successfully demonstrates a complete ServiceNow data import workflow from spreadsheet preparation to Import Set, Transform Map, Coalesce, validation, reporting, and dashboard visualization.
